Introduction

Are you also tired of spending endless hours arguing over where you should eat dinner, or where you should go for drinks? Have you also always wanted a tool that can help you and your friends decide how to spend your time?

Well then...

Congratulations!

By downloading this application you will have (almost) all your problems solved, and especially the ones introduced above! Right now you are looking at the *user manual* for probably the best application ever created. Through this manual we, the developers, want to help you get started with this journey of changing your and your friends lives for the better.

In this user manual you will find all the necessary means to learn how to use the application properly as well as how to interpret the information displayed.

What-To-Do in brief

What-To-Do is an activity based application that will help you decide how you should spend your time. The application is built on Google Places logic and thus ensures the user that the information displayed have a legitimate origin coming from Google's own search engine. This also enables What-To-Do to work anywhere in the world, and will most likely be your most valuable travel companion.

What-To-Do lets you choose between four different categories: bars, restaurants, recreational activities and mystery box. After you have chosen a category the application will randomize a place corresponding to that category and present name, rating, address and a map view to help guide you right.

Requirements

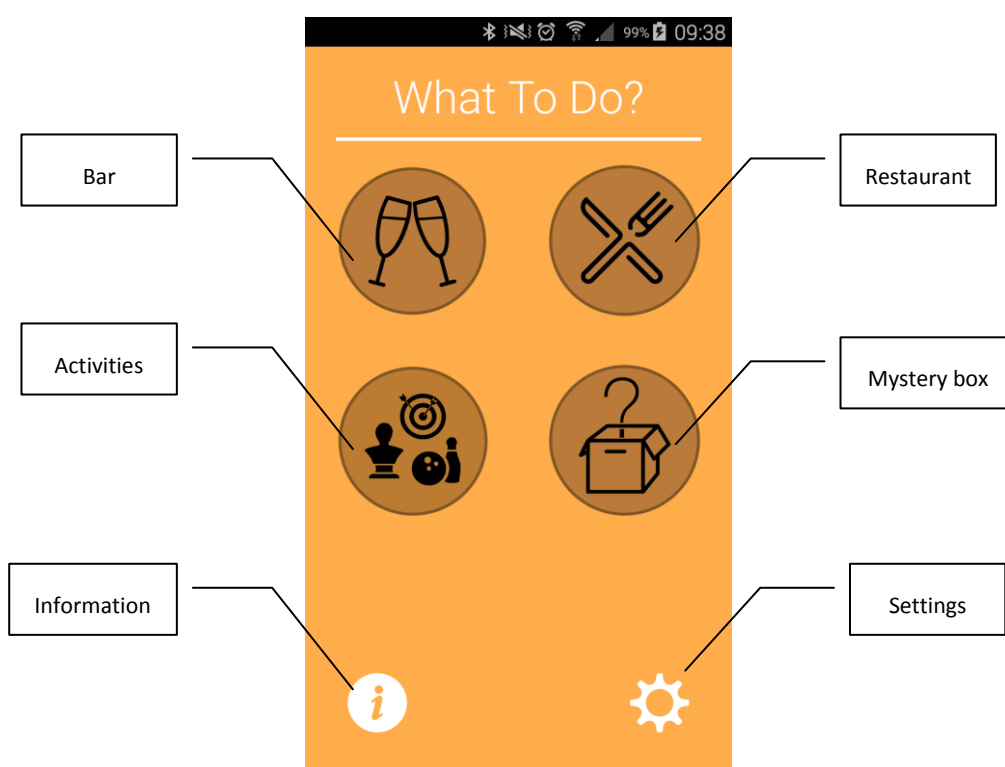

- Android Phone (that works)
- Internet connection (Mobile network or Wi-Fi)
- Money on your bank account (Not mandatory, the app is free but we can't guarantee that what will be proposed is)
- ID (or fake ID) if you want to experience the bar button
- Friends (Not mandatory but a lot more fun)
- We strongly advice that you are up for some serious fun before using this application.

Using the application

This section of the user manual will give you a brief overview of how to use the different functions and how to interpret the information displayed.

Main display

Opening the application will take you to the main menu which displays 6 different clickable buttons. Clicking one of the buttons will take you to a new display, more on this will follow.

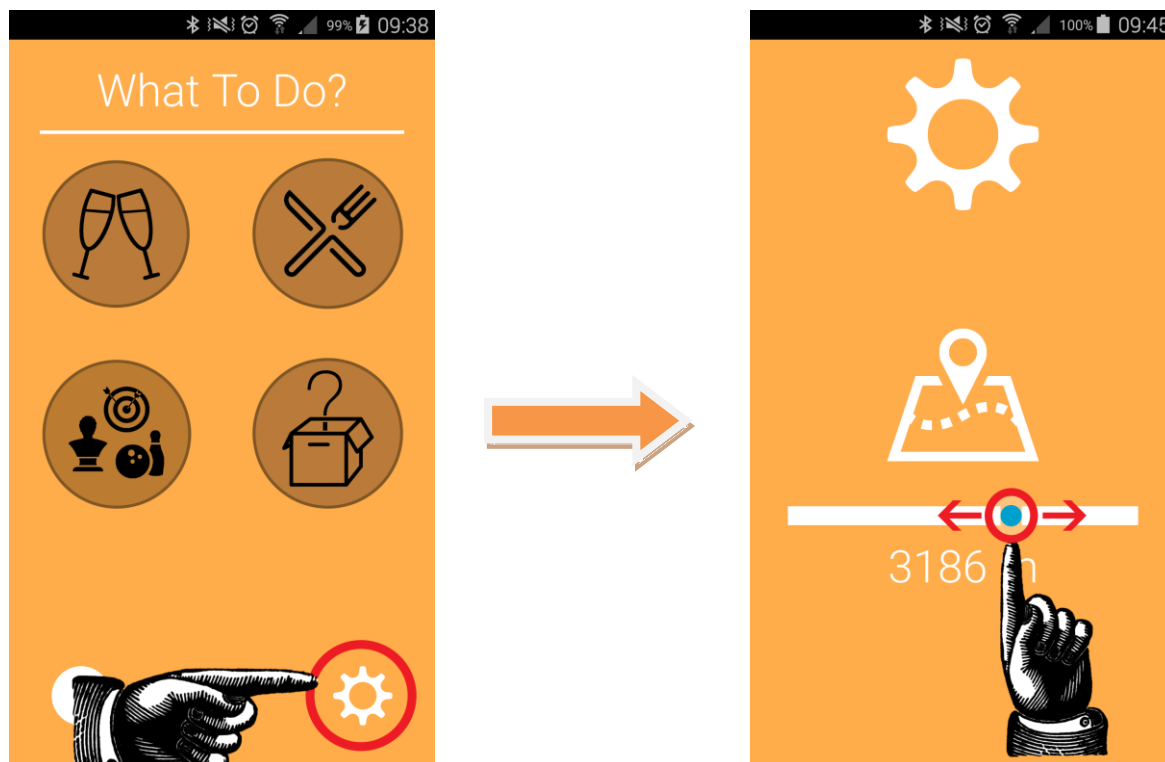

The four bigger circles with icons are the different categories you can choose from. In the upper left corner you have the button for bars, and below the bar button you have the recreational activities button. The upper right button is the restaurant button and below that is the mystery box button. These categories will be presented in detail further on.

In the lower right corner of the main display is the settings button that enables you to choose within what radius you want the application to search for places. In the lower left corner is the information button.

Set radius

The first thing you want to do is to decide the maximum distance from where you are right now to where you want to have a place presented. To do this simply press the *settings button*.

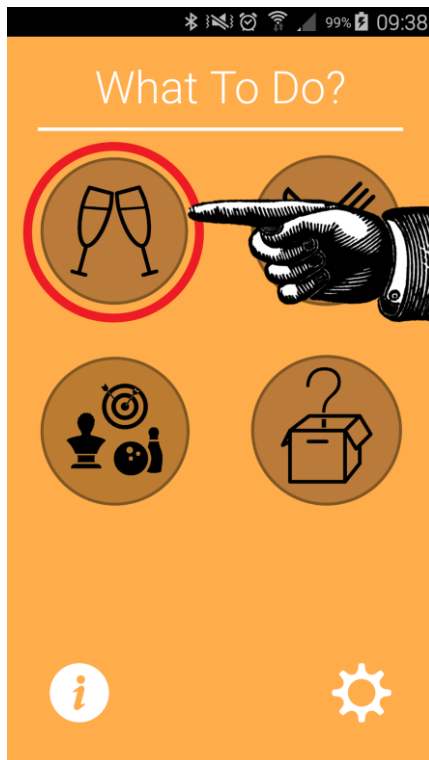

In the settings menu click the blue dot and drag it left or right to change radius. When desired radius is set, let go of the dot and you will be automatically redirected back to the main menu. If you want to change your radius again you can simply go back to the settings menu again and change it.

When your desired radius is set it is time to choose which of the four categories you want to go with. To do this simply click the desired category and let the application do the rest.

Categories

There are four different categories to choose from: bar, restaurant, recreational activities and mystery box. This section will explain what results you can expect from choosing a certain category.

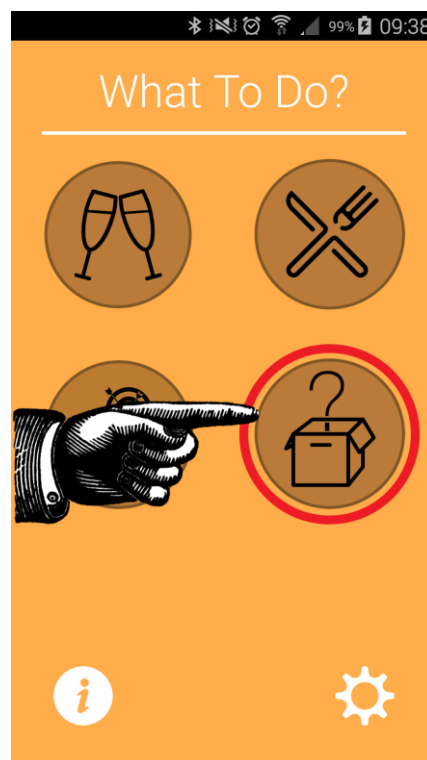

Bars, Night club, Sports bars

Restaurants

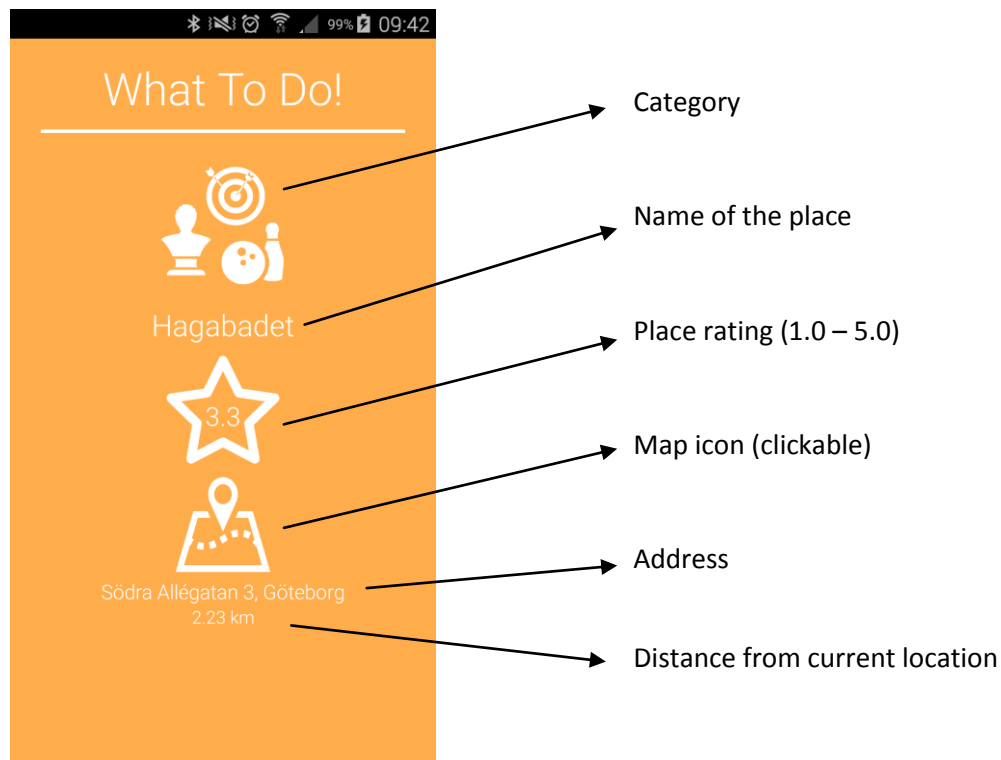

Museum, Spa, Pool-table, bowling

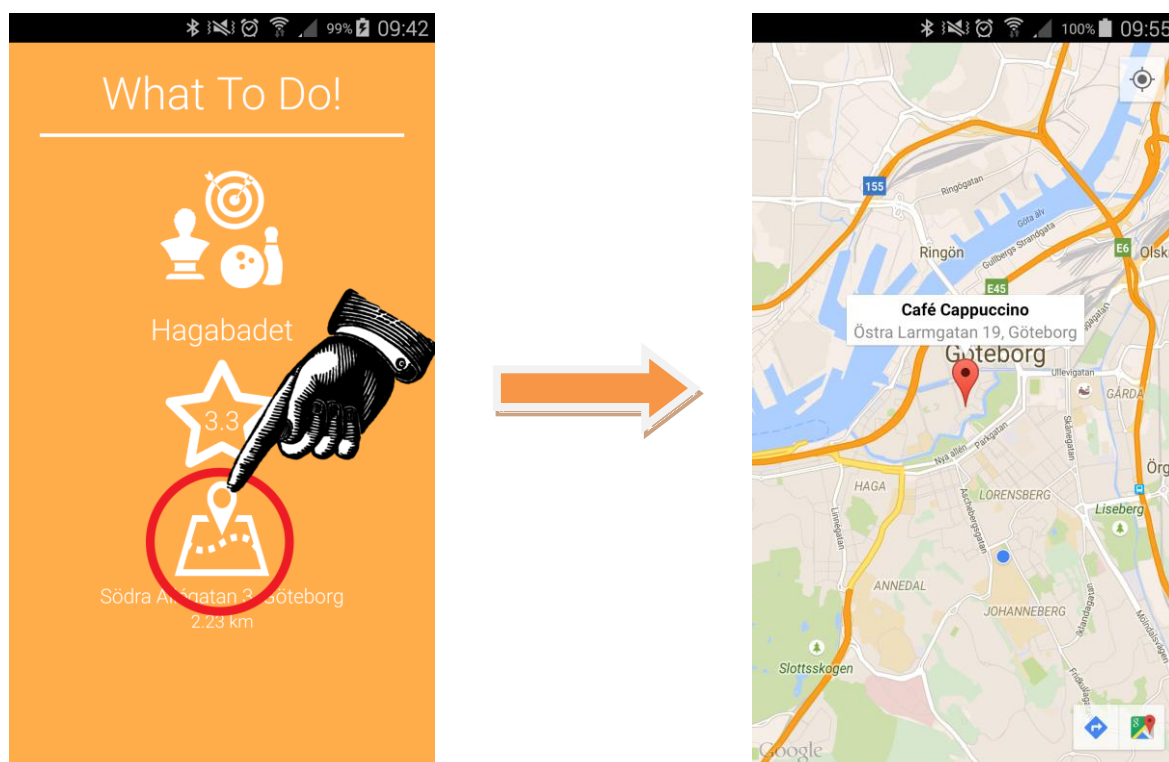

Are you adventurous enough?

Interpreting the results

After clicking on a category you will be presented with information about a random place within the desired radius and category. Note that only places that are currently open will be presented

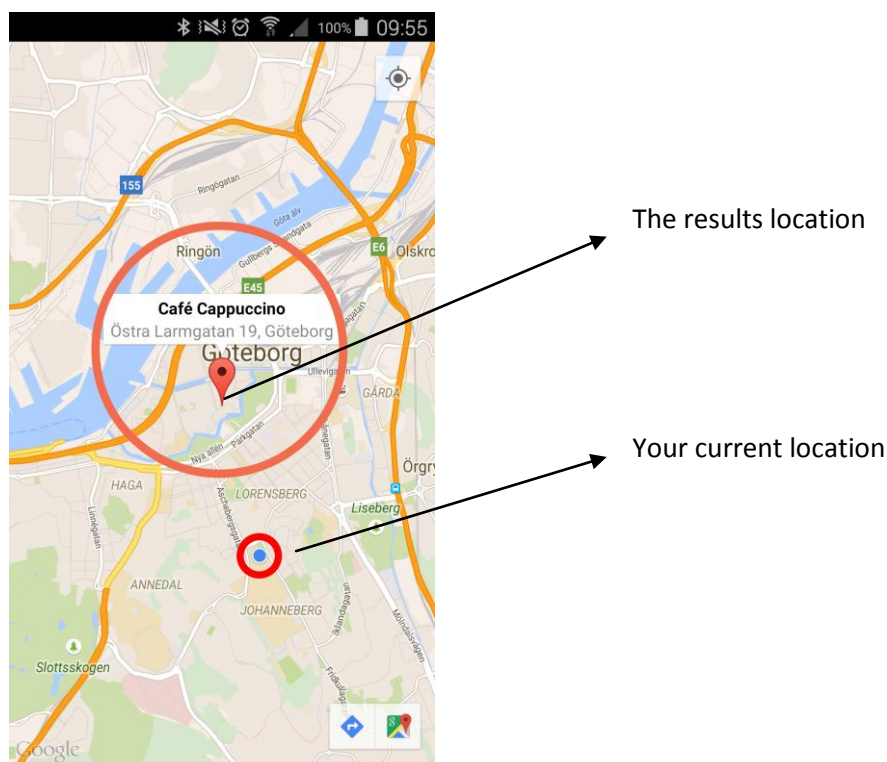

The map icon will open up a map view which shows you your current location as well as the results location. To access this map simply click the map icon.

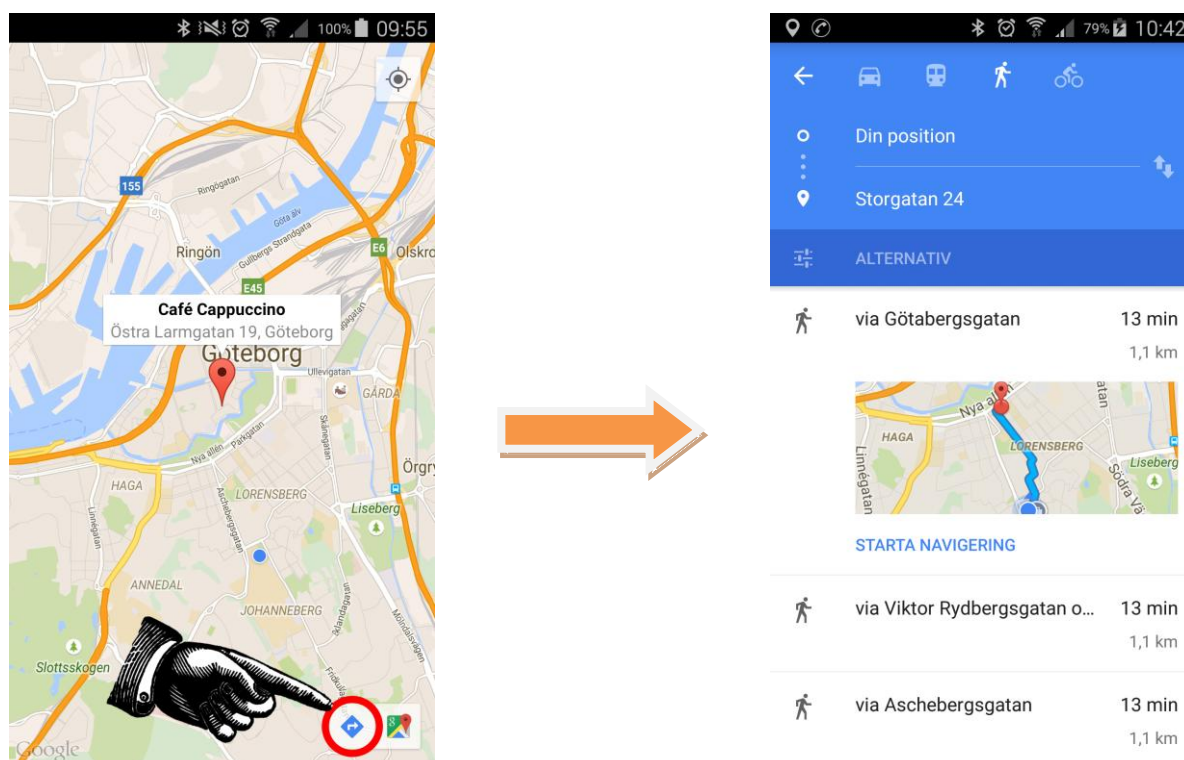

Using the map function

Clicking the map icon will open up a map view as displayed below.

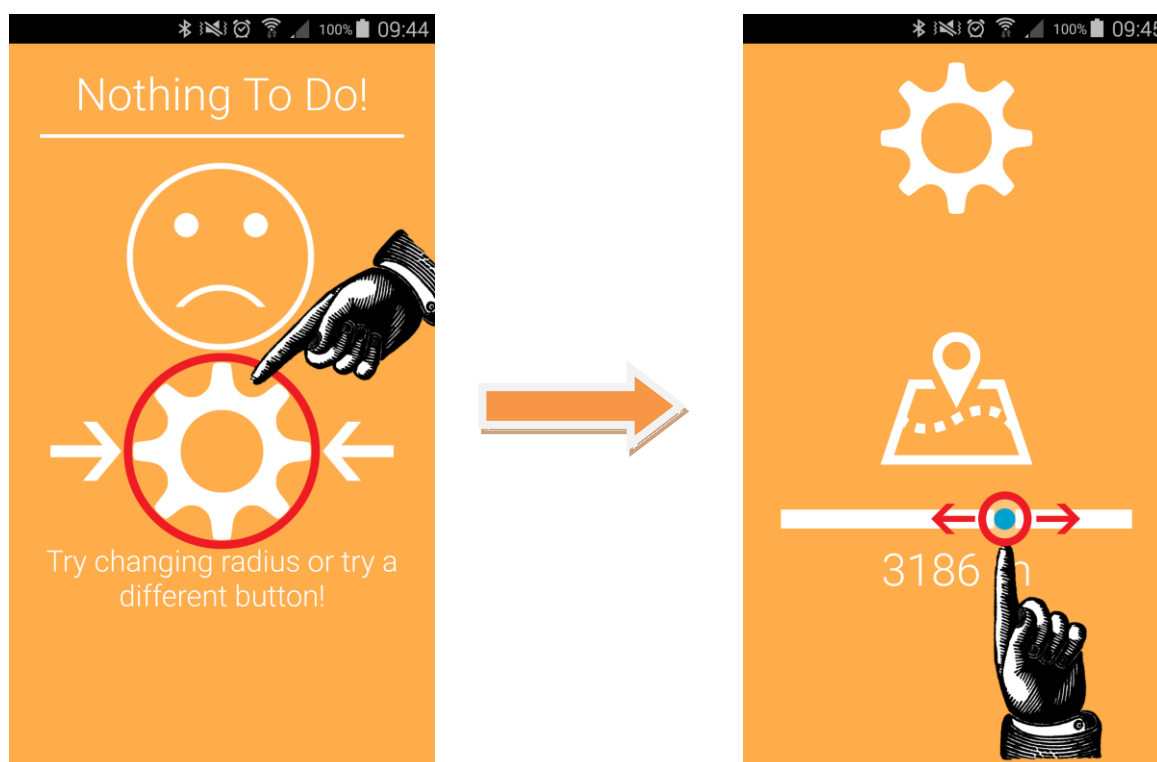

To navigate to the desired place click the lower blue icon. This will open up the Google maps application from your phone.

Managing a no result scenario

In some cases there are no places corresponding to your desired category within in the selected radius. This could be because your radius is too narrow or because there are simply no places open at the current hour. As mentioned before, What-To-Do will only present places that are currently open.

If no result is found you will see a display telling you that there is nothing to do and that you might want to increase your radius or change category and try again. To change radius, simply click the settings icon and you will be redirected to the settings menu, then just follow the steps explained earlier (*Set radius*) in this manual.

Words from the developers

We would once again like to congratulate you on downloading this application as well as to strongly advise you to share your thoughts of it with the world. Only then can all the world be happy.

We would like to thank Google for being Google and for supplying us with the tools necessary to create this extraordinary application. Without you there would be no What-To-Do and thus a much more boring everyday. We would also like to thank Chalmers University of Technology, and especially our lecturers Håkan and Morgan, for their support and faith in our idea. Creating a 7.5 ECTS course with the purpose of teaching students how to create applications was probably the best decision ever made in the history of Chalmers, at least according to us.

Thank you and enjoy you new best friend.
Yours Sincerely,
